

AppV1 Settings

All Pages · How to Enhance · What Is Not Necessary

2026-08-02 · SettingsView (phone tab + tablet sidebar)

This guide lists **every page/tab inside Settings**, what each contains, **how you can enhance it**, and **what is not necessary** (remove, hide, or move elsewhere).

Settings today has 5 tabs

Tab	Role today	Verdict
1. General	Real settings + tools mixed together	Keep — but clean up
2. Areas	Browse HA areas / devices (read-only)	Not a setting — move to Diagnostics
3. Entities	Flat list of all HA entities (read-only)	Not a setting — move to Diagnostics
4. A.I.	AI model + API keys	Keep — for admin/power users
5. Account	Profile, test push, logout	Keep — expand slightly

TAB 1 — GENERAL (main Settings scroll)

General is one long scroll with **4 sections** inside it. Treat each section like a “page”.

1A. Display

What is on this page: Toggles that change how the home / room UI behaves.

Item	What it does today
Show Family	Show person badges on the dashboard
Auto-Room (On Visit)	Open room sheet when location changes
Auto-Room (Resume)	Check location again when opening the app
Voice Assistant	Legacy center voice widget (mainly tablet). Phone uses Butler tab.
Show Preference Button	Show/hide Activate Preferences in room view
Automations	Opens Automations screen (not a display toggle)

How to enhance:

- Add **Card Appearance** here (opacity + overlay color) — modal already exists but is not linked.
- Group Auto-Room Visit + Resume under one “Auto room” row with a detail sheet.
- Rename Voice Assistant to “Tablet voice widget” so it is not confused with Butler.
- Add short “what this does” examples under each toggle.

Not necessary / should change:

- **Automations** does not belong under Display — move to Tools / Advanced.
- **Voice Assistant** is not necessary for phone users (Butler tab already covers voice) — hide on phone or remove if unused.

1B. Notifications

What is on this page: Controls how the house reminds / alerts you.

Item	What it does today
Still-Open Reminder	How often to remind (10–60 min) for open lock/sensor/garage/shutter
Monitored Entities	Opens modal to ignore entities for push
Alert Entities	Opens modal to create state-based alert rules

How to enhance:

- Show whether OS notification permission is On/Off + button to open system settings.
- Add Mute / Quiet hours (e.g. no pushes 11pm–7am).
- Rename “Monitored Entities” → “Ignored for notifications” (clearer).
- Move Test Push from Account into this section.

Not necessary / should change:

- Nothing here is useless — but names are technical. Keep features, improve labels.
- Still-Open is house-wide (backend). Label it clearly: “Affects this whole home.”

1C. Data & System

What is on this page: AI preference tools + FaceID + About.

Item	What it does today
Preferred Entities	Which entities AI may learn from
AI Learned Preferences	View learned patterns
Run AI Analysis Now	Live learning monitor
FaceID / Biometrics	Enable biometric login
My Preferences	On-demand AI room analysis
About	Version & developer info

How to enhance:

- Merge AI preference items into the **A.I. tab** (one place for all AI).
- Keep FaceID + About under Account (natural place).
- Fix My Preferences so it does not hardcode one person's tracker entity.

Not necessary / should change:

- **Run AI Analysis Now** is an admin/debug tool — not needed for normal homeowners; move to Advanced / Developer.
- Duplicate FaceID also exists on login Settings — keep one primary place (Account).

1D. Quick Actions

What is on this page: Shortcuts to other screens / labs.

Item	What it does today
Network	Wi-Fi / AP modal
History	History screen
My Statistics	Statistics screen
Insights	Insights screen
Entity History	Pick entity → history
Go to V3	Tablet widget dashboard experiment
Test TV	TV lab / remote test

How to enhance:

- If you keep any of these, put them under **Advanced** → **Tools**, not General.
- History / Statistics / Insights could live in a Home “Activity” tab instead of Settings.

Not necessary / should change:

- **Go to V3** — not necessary in Settings for end users; Developer only.
- **Test TV** — not necessary in Settings; Developer / lab only.
- **Entity History / Insights / My Statistics / History** — not “settings”; move out of Settings.
- **Network** — installer/admin tool; keep but under Connection / Advanced, not Quick Actions.

TAB 2 — AREAS

2. Areas

What is on this page: Read-only browser of Home Assistant areas → devices/entities with live state.

Item	What it does today
Area list	Shows selected / available areas
Area detail	Devices and entities in that area + live state

How to enhance:

- Add search / filter by domain (light, climate, cover).
- Tap entity → copy entity_id (helpful for support).
- If kept, rename tab to **Diagnostics** and put Areas + Entities inside it.

Not necessary / should change:

- **Not necessary as a main Settings tab.** Users do not “configure” anything here.
- Remove from primary tabs for homeowners; keep only for admin/support under Advanced.

TAB 3 — ENTITIES

3. Entities

What is on this page: Flat read-only list of live Home Assistant entities.

Item	What it does today
Entity list	All entities with state (browse / debug)

How to enhance:

- Add search box and domain chips (light / climate / sensor).
- Combine with Areas under one Diagnostics page (two sub-tabs).

Not necessary / should change:

- **Not necessary as a main Settings tab** for normal use — same as Areas.
- HA already has a better entity registry; this is only useful for in-app debugging.

TAB 4 — A.I.

4. A.I.

What is on this page: Choose AI provider, store API keys, test connection, save.

Item	What it does today
Active Model	openai / anthropic / gemini
API Keys	Per-provider keys + Test buttons
Save Configuration	Persist keys + active model on device

How to enhance:

- Move Preferred Entities / Learned Preferences / My Preferences here from General.
- Mask keys by default; show last-4 characters only.
- Store keys **per home profile** (Office vs Majeed should not share keys).

- Show which features use AI (Butler, preferences, analysis).

Not necessary / should change:

- For pure homeowners who never touch API keys: hide this tab behind Admin / Developer.
- Do not leave unused provider key fields confusing if only one model is used — collapse inactive ones.

TAB 5 — ACCOUNT**5. Account**

What is on this page: User identity, test push, logout.

Item	What it does today
Profile header	Shows name; role always says “Administrator”
Test Push Notification	Sends a test push via admin backend
Log Out	Clears session and returns to login

How to enhance:

- Add **Connection / Home profile** here: HA URL, Admin URL, switch profile (today only on login screen).
- Move FaceID here from Data & System.
- Show real role from backend (or remove fake “Administrator”).
- On logout, clearly say what stays (profiles, AI keys) vs what clears (session).
- Move Test Push under Notifications.

Not necessary / should change:

- Hardcoded **Administrator** label is not necessary / misleading — remove or make real.
- Empty section stub in code (“Transferred to General”) — clean up dead UI.

SUMMARY — Keep · Move · Remove

Keep in Settings (core)

Keep	Where
Show Family, Auto-Room, Preference Button	Display
Still-Open Reminder, Monitored, Alert Entities	Notifications
FaceID, Logout, user name	Account
About	Account (or footer)
AI keys / model (for admins)	A.I. tab
Card Appearance (add it)	Display
Connection / Profiles (add it)	Account or new Connection tab

Move out of main Settings (still useful elsewhere)

Item	Move to
Areas + Entities tabs	Advanced → Diagnostics
History, My Statistics, Insights, Entity History	Home Activity / Insights area (not Settings)
Automations	Own tab or Advanced → Tools
Network	Connection / Advanced (installer)
Run AI Analysis Now	A.I. → Advanced / Developer
Preferred / Learned / My Preferences	A.I. tab (one AI home)
Test Push	Notifications section

Not necessary for normal users (hide or delete from Settings)

Item	Why not necessary in Settings
Go to V3	Experimental dashboard — developer only
Test TV	Lab tool — developer only
Voice Assistant (phone)	Butler tab already provides voice on phone
Areas / Entities as main tabs	Read-only debug, not configuration
Hardcoded “Administrator”	Fake role; adds no value
Duplicate FaceID on login + Settings	Keep one clear place

Recommended final Settings structure

Tab / Section	Contains
Display	Family, Auto-Room, Preference button, Card Appearance, (optional tablet voice)
Notifications	Permission status, Still-Open, Ignored entities, Alerts, Test push, Quiet hours

Tab / Section	Contains
Connection	Active home profile, HA URL, Admin URL, token (masked), Network, Butler status
A.I.	Model/keys + preference tools (admin)
Account	Name, FaceID, About, Logout
Advanced (optional)	Diagnostics (Areas/Entities), Automations, Developer (V3, TV Lab)

Bottom line. Settings today mixes real preferences, admin tools, and developer labs. Keep Display + Notifications + Account. Move Areas/Entities and history tools out of the main path. Remove or hide V3 / Test TV / phone Voice Assistant. Add Card Appearance and Connection — those are the biggest missing pieces.
